

Hints For Creating A Game

It's important that you start off well and keep your code nicely formatted. This will help you find and modify the code as you go through this project. After every major set of code you write, use the "Format Document" functionality found in Visual Studio Code. Type Control+Shift+P on Windows, or Command+Shift+P on macOS, to bring up the commands dialog. Type enough of "Format Document" until you see it appear at the top of the list. When it is highlighted, you can just hit "Enter" to format your code.

Keep your developer tools open in Chrome to see any JavaScript errors that may get introduced as you go along. If you read things about values not being exported, make sure you're using the `export` keyword in the files that you're defining your classes in. If you read things about not being able to access property *something* of value **undefined**, then that means either you have a variable that's not set or you're trying to do something with a value that doesn't exist that you tried to pull out of an array.
